

Backup Recovery Solutions:

What is a Backup?

A full recovery backup is a procedure to allow your data, software and windows configurations to safely backup and recover in times of emergency.

Not having a backup?

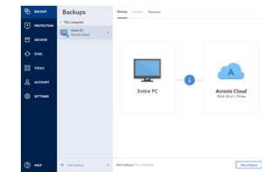

When your computer, client pc or server crashes it may lose all custom settings, software integrations, network share protocols & data.

Solution:

Why Backup and Clone?

Having a backup of your computer not only saves the data, it will also save the computer settings, software and custom network connections.

Keep IT Working ...

Every business suffers from computer problems - they regularly crash, systems freeze or hang, viruses infect, hackers attack your PCs and documents become corrupt and lost.

This directly impacts your business productivity.

With our support these risks are greatly reduced!

Recommendations:

Buying external hard disk to attach to pc Client to backup Server data through network. making a backup file system.

Have your current I.T. schedule a full backup of server with Acronis software on an external for your company to have a safe record and solution to repair later.

Backup all client computers to externals on 2 drives for 2 copies to ensure faster repairs and down time.

Purchase an identical Server refurb from Ebay or similar. This will ensure part replacements and less downtime if server damages.
